An innovative Relationship Building Tool

We are seeking a full-stack developer who can help launch a basic iOS prototype for us to bring to our investors. The mobile application will need to include several different functionalities:

1. API coding - enabling us to interface with new feeds
2. Information (data) storage - similar to a Customer relationship management (CRM) system. Users will be able to build profiles & store important information on their customers/prospects.

We would love the chance to speak with you about the opportunity.

Go Eagles!
